TITLE: A pulse counter. Class 42, No. 181876 [announced by the VEF State Electrical Engineering Plant (Gosudarstvennyy elektrotekhnicheskiy zavod VEF)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 10, 1966, 97

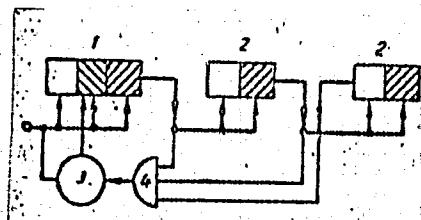

TOPIC TAGS: flip flop circuit, pulse counter, coincidence circuit

ABSTRACT: This Author's Certificate introduces a pulse counter containing a tristable flip-flop and two bistable flip-flops connected in series. The unit is designed for producing eleven states in 1-2-3-5 code. The counter input is connected to the counter input of the tristable flip-flop with simultaneous connection through a diode to the auxiliary set terminal for the second digit on this flip-flop. The second input of the diode is connected to the output of a coincidence circuit with inputs tied to the last digit of the tristable flip-flop, the second digit of the first bistable flip-flop and the first digit of the second bistable flip-flop.

TITLE: Transistorized pulse generator. Class 21, No. 177456

SOURCE: Izobreteniya, promyshlennyye obraztay, tovarnyye znaki, no. 1,  
1966, 34

TOPIC TAGS: pulse generator, transistor, transformer

ABSTRACT: An Author Certificate has been issued for a transistorized pulse generator consisting of a blocking oscillator and reactive trigger. To extend the duration of the oscillation period and increase the stability of generated pulses, the output winding of the blocking generator transistor is connected with the input of the reactive trigger.

1087. A TRIAL OF INFLUENZA VACCINE IN THE BELORUSSIAN SSR (Russian text) - Zubitsker D. E., Selivanov Ya. M., Fasko T. A. and Gosilovskaya A. E. - VOPR. VIRUSOL. 1956, 6 (43-47)

During autumn and winter 1954, 44,247 inhabitants of Minsk and Vitebsk received intranasally (0.2-0.3 ml. or 5 drops in each nostril) a dry, live, polyvalent influenza vaccine. The vaccine was administered to industrial workers, college and institute students, older schoolchildren and medical and auxiliary hospital and dispensary staff. Younger schoolchildren and pre-school children were excluded, in view of their high sensitivity to such a vaccine. As a result of a single vaccination, the incidence of influenza and upper respiratory catarrh was lowered 2.2 times and the loss of man-hours 2.6 times. An insignificant number of local and general reactions such as nasal discharge and headache were observed. A very mild reaction was observed in 9.8%, a mild reaction (pyrexia 37.5°C.) in 0.6%, and a moderate reaction (pyrexia higher than 37.5°C.) in 0.17% of all vaccinated individuals.

AUTHORS: Votyakov, V.I. and Zubitsker, D.Ye.

TITLE: The Belorussian Institute of Epidemiology, Microbiology and Hygiene on  
the Occasion of the 40th Anniversary of the Belorussian SSRPERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1959, № 6,  
pp 112-117 (USSR)

ABSTRACT: This is a history of the Belorusskiy institut epidemiologii, mikrobiologii i gigiyeny (Belorussian Institute of Epidemiology, Microbiology and Hygiene), its activities and some of its scientific associates. Among the well-known scientists who received their training at the Institute are: Honored Scientist, Doctor of Medical Sciences, Professor B.Ya. El'bert, Corresponding Member of the AMN, USSR, Doctor of Medical Sciences, Professor E.K. Mogilevchik, Doctor of Medical Sciences, Professor I.A. Sutin, Doctor of Medical Sciences S.I. Gel'berg, Docents and Senior Scientific Associates I.S. Rubinshteyn, V.I. Votyakov, A.O. Sakovich, D.Ye. Zubitsker, Ye.Ye. Sokgobenzon, B.B. Rubinshteyn, G.I. Rakhmanchik, Candidates of Medical Sciences M.Sh. Levin, R.I. Levina, A.V. Gritskevich, Ts.A. Perlis, L.I. Nikonorovich, etc. The Institute produces one of the best tuberculosis vaccines in the USSR. It has conducted a number of investigations (Brandin,

Card 1/5

SOV/16-59-6-23/46

The Belorussian Institute of Epidemiology, Microbiology and Hygiene on the Occasion of the 40th Anniversary of the Belorussian SSR

Frid, etc.) to improve the microbiological methods of diagnosing tuberculosis. The Institute has studied the importance of the neuroreceptor areas in rabies infection in animals and in immunization with rabies antivaccine. Zubitsker and Korotkevich have developed a method of determining the immunogenic properties of rabies vaccines by infecting immunized mice with fixed rabies virus. Attempts are being made to prepare a dry rabies vaccine. The Institute has devised experimental techniques for estimating the virulence of small-pox vaccine in guinea pigs, has carried out clinical investigations on immunized children and studied means of preserving the heat-resistance and immunogenic properties of small-pox vaccine. Studying the mechanism of paratyphoid B fever and immunity, Rabinovich showed the importance of the barrier function of the Mechnikov macrophage system and the other elements of the reticuloendothelial system. Attempts to improve dysentery bacteriophage were made by using the technique of guided variation of *Shigella shigae* and *Escherichia coli*. Manolov, Rakhmanchik, Kruglik, Kulikova and Timofeyeva in 1955 tried to rationalize the different methods of dysentery diagnosis. Studies of nidi of infections caused by pathogenic *Escherichia coli* have also been performed. In its work on diphtheria the Institute has done

Card 2/5

SOV/16-59-6-23/46

The Belorussian Institute of Epidemiology, Microbiology and Hygiene on the Occasion  
of the 40th Anniversary of the Belorussian SSR

research in: the selection of horses for diphtherial hyperimmunization, preserving immune sera with chinosol, the titration of immune sera and the reactive properties of crude, heated and refined sera, the removal of ballast proteins from sera (Levin and Sosina). A number of bacteriological and experimental investigations have established the desensitizing action of novocaine and the magnesic drugs, also the desensitizing and antibiotic properties of citral. Livshits, Agronovich, Bukhovtsova, etc. have demonstrated that citral has good therapeutic effects on furunculosis, postnatal infections, stubborn forms of rheumatic polyarthritis and shin ulcers. Votyakov and Nikonorovich have demonstrated the importance of functional changes in the central nervous system in the pathogenesis of gas gangrene. The Institute has developed a method for the differential diagnosis of the scleroma bacillus from the other microbes in the capsule group, using agar-microscopy, and has described new varieties of bacilli in this group. It constantly organizes expeditions to study the epidemiology of scleroma in Belorussia and has also taken an active part in the anti-malaria campaign. Studies have been made of the natural foci of tularemia in Belorussia and the Institute has demonstrated the effectiveness of vaccination against this disease. The Institute's workers have

Card 3/5

SOV/16-59-6-23/46

The Belorussian Institute of Epidemiology, Microbiology and Hygiene on the Occasion  
of the 40th Anniversary of the Belorussian SSR

traced the source of brucellosis to cattle and attribute the spread  
of leptospiroses to field and domestic rodents. Protas, Savitskiy, etc.  
have put forward the hypothesis that the seasonal outbreaks of encephalitis  
in Belorussia are caused by infected goat's milk. Selivanov, Zubitsker  
and Votyakov have studied the etiology and epidemiology of influenza and  
the efficacy of influenza vaccination. Studies have also been made on:  
the epidemiology and early diagnosis of epidemic hepatitis; aldolase  
activity as an index to the diagnosis of Botkin's disease; the efficacy  
of intradermal immunization with the Salk vaccine. The Institute is  
investigating the sporadic outbreaks of typhus and is working on a method  
for preparing a rickettsiosis antigen from lice adapted to rabbits  
(Kosobutskiy). Indications have been received that trichinosis is wide-  
spread among wild animals in Belorussia. Trichinella antigens have been  
prepared and immunological methods of diagnosing this disease worked out.  
Similar work has been performed on diseases caused by tapeworms, enteritic  
protozoa and Toxoplasma. New laboratories have been set up to produce

of the 40th Anniversary of the Belorussian SSR

gamma-globulin, diagnostic preparations, including dysentery, typhoid,  
scleroma, dry complement and hemolytic sera. The Institute has mastered  
the production of antirabies vaccine from sheep's brains. The Institute  
works in close cooperation with the Belorussian public health service  
and also does much to improve the scientific qualifications of its  
associates.

PERIODICAL: Zhurnal Finicheskoy Khimii, 1958, Vol. 32, Nr 3,  
pp. 707-709 (USSR)

ABSTRACT: In connection with work performed on types and subtypes of  
hydrocarbon bonds and with corresponding analysis of their  
physicochemical properties a formula is given by which the  
phenomena mentioned in the title can be determined. The  
results of the determinations performed with a series of  
substances are given in a table. They show good agreement  
with the experimentally obtained values. The given scheme  
of calculation is more suitable than Pascal's scheme (and the  
modifications), and moreover does not possess any additive

Hydrocarbons and Alcohols

constants. The applied theoretical expressions of the stability of the physicochemical quantities (with the nature of a capacity factor) can, according to the results in comparison with the experimental data, be well used. In this manner the importance of the physicochemical properties of organic compounds can be explained and predicted on a much broader basis than it was possible before. There are 2 tables and 8 Soviet references.

TITLE: Phasemeter of ultralow electrical oscillation. Class 21, No. 189942

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 1, 1967, 46

TOPIC TAGS: phase measurement, phase METER, OSCILLATION

ABSTRACT: An Author Certificate has been issued for a phasemeter to measure ultralow electrical oscillations. The phasemeter consists of input comparator circuits to shape pulses while input signals are passing through zero, a trigger, a linearly varying voltage generator, and an output memory circuit. In order to provide automatic phase measurement directly in degrees, and to insure the independence of readings from the value of the direct component of input signals, the linearly varying voltage generator is designed as an integrating amplifier whose input is connected to the outputs of the frequency meter and an inverter, at the frequency meter output through the series networks which consisted of a diode and an input resistor. The control key circuits are connected to the diode junctions. [GS]

 AUTHOR: Successes of Soviet Electrophotography (Uspeshi sovetskoj elektrofotografii). A Scientific and Technical Conference on Questions of Electrophotography (Nauchnoe zashchita konferentsiya po voprosam elektrofotografii).  
 PERIODICAL: Zhurnal nauchnyj i prakticheskij fotografi i kinematografii, 1959, Vol. 4, Nr. 2, pp. 150-152 (USSR)

ABSTRACT: This is an account of a scientific and technical conference on electrophotography, the first to be held in the Soviet Union and evidently the world. It was organized in Vil'nyus on December 16-19, 1958 by the Soviet Lithuanian Kharyava Litovskoyem (Council for National Economy of the Lithuanian SSR), the Goumardzhevichno-Sekundinovskiy Komitet Sovetskogo ministrstva Vneshno-tekhnicheskogo Komiteta Sovetskogo ministrstva Litovskoy SSR (State Scientific and Technical Committee of Lithuania of the USSR) and the Council of Univerzitetskij institut elektrofotografii (Scientific Research Institute of Electrophotography). The conference, attended by over 200 scientific workers, was opened by the Deputy Chairman of the Council of National Economy of the Lithuanian SSR Prof. Kukute, after which the Director of the Institute for Electrophotography, I.I. Zhdanovich, reviewed the state and prospects for development of electrophotography in the USSR. He stated that research in this field should be carried out along the following lines: a) a search for new photo-active materials with high dark resistance; b) physical research into the internal photoeffect; c) development of photoconductor layers; d) development of the theory of the electrophotographic process. K.S. Lysakov (speaking also for O.G. Fokov) reported which he suggested dealing with the latent sensitivity of electrophotographic layers in GOST 11.7.1-57. Plavina (Speaking also for I.I. Zhdanovich, I.I. Semenov, N.V. Markovich, B.I. Kallinauskas and O.M. Svirskis) reported on some research on the sensitization of a semiconductor in electrophotographic layers. T. P. Pechkina gave a report on highly sensitive electrophotographic layers and electrofotopropoging device, and reviewed the present stage of the latent electrophotographic image on the basis of the zonal theory. He also described the design of an electrofotostimometer for determining sensitivity of the layer and the circuit of a charge on the surface of the layer and the circuit of an electrofotopropogic copying device. In addition, he finished describing the latter and then spoke on the mechanics and kinetics of the development of the latent electrophotographic image in liquid developers.

Card 3/0

SC7774-2-15/8  
 Successes of Soviet Electrophotography; A Scientific and Technical Conference on Questions of Electrophotography

I.M. Vinogradov described some of the features of the cascade and liquid methods of electrophotographic development. Yu.I. Karpenko devoted his report to the criterion of light sensitivity of the electrophotographic process. After the reports, a discussion took place on methods of determining the light sensitivity of electrophotographic layers. A.N. Chernyshev spoke on the prospects of developing photorefractive processes using electric and magnetic forces. O.V. Gromov (speaking also for N.A. Zhil'evich, A.I. Shubin, V.A. Gordiyeva, A.S. Puzina and Yu. N. Kaval'yev) spoke on the development of electrophotographic reproducing equipment. A.S. Puzina (speaking also for I. V. Gavril'dik and N. I. Slobodkina) reported on the use of electrophotographic methods in recording oscillographs and other recording instruments.

V.P. Turchenko (speaking also for L.M. Sulin) spoke on the possibility of electrophotographically recording images from electron-beam tubes. L.S. Korol' (speaking also for N.M. Markovich, T.I. Kalininskaya, M.E. Baynes, R.J. Milne and B.I. Vorozhbitskaya) gave a detailed description of laboratory and machine methods of producing photoconductive papers (titanium dioxide was used). A.A. Slobodkina (speaking also for I.I. Zhil'evich, O.V. Gordiyeva, Yu. F. Zhdanov and F.N. Ger) described a laboratory and industrial machine for producing photoconductor papers. T.A. Shchukina (speaking also for Ya. N. Oksanen) reported on a method of etching electrophotographic materials using an arc bridge. S.I. Khol'shannikov (speaking also for A.I. Glince and I.S. Shul'nikov) spoke on developing cascade methods for electrophotography and ferromagnetic papers, including developing a reverse image. D.I. Melnikov reviewed methods of measuring the dielectric constants of electrophotographic layers, stressing that the oscillating potential should not be placed above a layer with variable potential (speaking also for R.J. Colver and A.Y. Ovchinnikova).

S.D. Chikishev (speaking also for V.V. Kostylev) spoke on the production of electrophotographic samples. Papers produced by the Grič machine were shown. E. G. Troitskaya then gave a historical review of the development of electrographable methods in which she paid tribute to the work of the Scientific Research Institute of Electrography in Vil'nius—the Institute poligraficheskogo mashinostroyeniya (Institute of Polygraphic Machine Building Institute (Laserer)). Debates were then held.

Card 6/10

on methods of recording the potential of charged electro-photographic layers as shown in B.I. Timchenko's "The Vibrating Pick-up Method" report to be not always accurate. S.G. Grinblat has stated that the bad influence of the oscillating electrode can be eliminated if the electrode probe above its surface is fixed and if the pick-up is connected to it by a shielded cable. In the paper on X-ray, Nezovskiy's report was cited that the research work of academician A.N. Tsvetan and Yu.K. Butyrko should be considered as the basis of all work on electrophotography. Papers with the title "The first to show the possibility of using the relaxation properties of the internal photoeffect in ZnO, M.W. Gol'yan and V.M. Yankul'ev gave a report on the deposition of charges on electrophotographic methods in radiography. L.I. Vinogradova and A.P. Vinogradov also spoke on the results of experiments for I.I. Zil'fovich and Yu.I. Vinogradov. I.Z. Pashin, Yu.K. Nezovskiy, Yu.K. Vinogradova reported on relaxation properties in semiconductor layers. On "Electro-physical Properties of the Polycrystalline Layers of Selenium and Cadmium," K.P. Mikhalkovich spoke of the photoelectric properties of polycrystalline layers of selenium. A.M. Kozachenko spoke on some absorption characteristics of CdS<sub>2</sub> and Sb<sub>2</sub>S<sub>3</sub>; the latter is about 900 m<sup>-1</sup>. The light-sensitive layers, including selenium, were also found to sublimate and other properties increased after storage for 1.5 to 2 months at room temperature. P.M. Petropavlovsk (speaking on electrical properties of electrophotographic layers) spoke of research into the diffusion absorption of selenious and powdered zinc oxide of Shchitov (speaking also on the production of standard alloys). The production of light-sensitive layers and magnetotography. Finally, the following reports on ferromagnetic "electrodeposition" were delivered: 1) N.Ya. Kaznacheyev, "Visualizing Magnetic Characteristic of Magnetic Oscillations"; 2) N.T. Arutyunyan, "Graphic Recording of Ferromagnetic Images"; 3) V.P. Patrunov, "Graphic Recording of Ferromagnetic Images"; 4) T.V. Bulycheva, "Graphic Recording in Non-Hysteretic Materials"; 5) G.I. Glikman, "Graphic Recording of Magnetic Images." There was also an exhibition showing the work of the Graphic Institute. The most important conclusion to the conference was that a solid approach had been made to the possibility of wide technical use of this method. It was considered that although the methods had already been known for 10 years, their application to reproduce results already achieved that it was necessary to produce results first to arrive at them; the conference concluded that no important application appeared in the literature available.

AUTHORS: Zubits, Yu. A., Nyun'ko, L. I.

TITLE: On the problem of half-tone transmission in electrophotography

PERIODICAL: Zhurnal nauchnoy i prikladnoy fotografii i kinematografii,  
v. 5, no. 5, 1960, 352 - 355

TEXT: It was the aim of the present work to estimate the transmission of half-tones according to the variation of the surface potential of a semiconductor layer on exposure, considering that intersubstitution is not fulfilled. The authors employed a semiconductor layer of zinc oxide, part of which was sensitized with eosin. The surface potential of the semiconductor layer was measured with a dynamic electrometer featuring a vibrating glass electrode coated by a thin conductive  $\text{SnO}_2$  film. A low-frequency oscilloscope with the electron-beam deflection gauged in volts was used as a recording instrument. Exposure was brought about by means of a shutter from a "Zorkiy-4" camera supplying nearly rectangular pulses on exposure times of 1, 1/2, 1/5, 1/10, and 1/25 seconds. The dependence of the potential drop  $\Delta V$  on the initial potential  $V_0$  in the case of an exposure

On the problem of half-tone...

with constant light pulses is shown in Fig. 1. As can be seen,  $\Delta V$  increases linearly in the case of low  $V_0$ ; saturation is reached when  $V_0$  is high. Fig. 2 shows the dependence of  $\Delta V$  on the exposure of an unsensitized layer for the case of a constant shutter aperture and an equal initial potential  $V_0$ . In Fig. 3, the same is shown for a sensitized layer. In the discussion of the results, the authors conclude that the potential drop arises from production of free charge carriers. It is further concluded that a correct transmission of half-tones by means of a potential relief forming upon the semiconductor layer on exposure is possible only if the potential drop depends linearly on the exposure time. This can only be obtained in the case of short exposures and high shutter speeds. Sensitization of the semiconductor layer narrows that exposure range in which a correct transmission of half-tones is possible. Moreover, by this method a correct transmission of the half-tones in electrophotographic prints is possible only if the potentials of the various sections on the surface layer are exclusively in the range of linear dependence of the density of blackening on the surface potential. The Kaunasskaya bumazhnaya fabrika im. Yu. Yanonisa (Kaunas Paper Mill imeni Yu. Yanonis) is mentioned. There are 3 figures, 1 table, and 13 references: 10 Soviet-bloc and 3 non Soviet-bloc.

ABSTRACT: An investigation is made of the spectra and kinetics of impurity photoconductivity of silicon doped with copper, molybdenum, and platinum. The effective cross-sections of electron and photon capture at the copper and molybdenum levels were determined. The characteristics of photoconductivity relaxation in Si(W) samples were analyzed and explained. Samples of Si(Pt) were used to study the laws

TITLE: Occurrence of photo emf in a homogeneous semiconductor on the separation boundary between regions of different degrees of optic ionization of the impurities

SOURCE: Fizika tverdogo tela, v. 8, no. 7, 1966, 2240-2242

TOPIC TAGS: photo emf, semiconductor impurity, ionization, impurity level

ABSTRACT: Since normally the production of a photo emf calls for the presence of inhomogeneities in the semiconductor, the authors show that under certain conditions it is possible to produce a photo emf in a perfectly homogeneous semiconductor by illuminating it with two beams of light having different spectral compositions. In one region the energy of the light should be sufficient only for ionization of the shallow levels, and in the other, the quantum energy should be sufficient for formation of electron-hole pairs. Occurrence of photo emf is essentially due to an impurity-ionization gradient produced by uneven illumination in the spectral region of impurity absorption. The magnitude of the photo emf is calculated and it is shown that it is of the same order of magnitude as the volume emf, and can reach tens of millivolts under favorable conditions. Measurements on p-type germanium doped with gold, using a beam of infrared light, confirmed the calculations. The authors thank S. M. Ryvkin,

Significant elevation of the values of the Brdička reaction, the  $\alpha_{3-4}$ -globulins and  
the glycoproteins with  $\alpha_{3-4}$  mobility on paper was found after a dose of 600 r. This  
commenced on the 2nd day after irradiation and reached a maximum just prior to  
death. The changes are non-specific and are due to the general effects of ionizing  
radiation on the organism. All initial values of the above-mentioned analyses in the  
surviving animals were lower than those in the animals which succumbed.

"Damage Caused to Pyridine Nucleotides in an Irradiated Organism."

Prague, Veterinarni Medicina, Vol 13, No 2, Feb 67, pp 107-118

Abstract /Authors' English summary modified: Changes caused by an irradiation dose of 42,000 r to NAD(nicotinamide adenine dinucleotide) and to NADH<sub>2</sub> (dihydronicotinamide adenine dinucleotide) were investigated in vitro. Fluorescence maximum of NAD decreases in anaerobic conditions, in aerobic conditions there is little change. The amount of pyridine nucleotides in rat liver decreases after a whole body dose of 1400 r. The irradiated liver maintains its normal reduction capacity within 15% for 3 hours after exposure. The total level of pyridine nucleotides in isolated mitochondria of rat liver also decreases after an irradiation dose of 1400 r. However, the mitochondria maintain their ability to transfer H-proton. 8 Figures, 5 Tables, 31 Western, 2 Czech, 1 Japanese references. (Manuscript received 3 May 65).
